In terms of applications that will take advantage of these results in the most feature-rich motherboard on the X58 platform. The second feature they offer This results in a better motherboard for overclocking versus the GM-M board which Motherboards ECS is known for having less expensive products than their competition and the ECS H55H-M motherboard is a perfect example of using a mainstream chipset without all of the bells and whistles of the competition to deliver a motherboard. The inclusion of so many new features can cripple the performance. The integrated graphics are good enough to run Blu-ray discs when paired with a powerful processor like the Core Full support of Blu-ray playback and encoding. While the cost of a Xeon system is expensive for the most high-end CPUs, their Motherboards This board performs great, with performance in the same class as other motherboards in this chipset. Overclocking was a bit of a mixed bag as the CPU was able to overclock to 4GHz without issue but the voltage options did not. Motherboards Phase Power and much more bring this board to one of the most feature-rich P55 motherboards on the market today. The inclusion of an external SATA kit with all the wires and cables needed adds additional value to the board. Motherboards ASRock is not well known in the enthusiast community as they often have niche motherboards based on esoteric chipsets with unique features found nowhere else. The board overclocks decently, but the real treat for this board is on the automatic overclocking that Turbo Boost provides. The board automatically changes the multi First is the ability to do Voltage Checkpoints, which the other board cannot do. Second is the higher Overclock ability slightly.
