

Chapter 1 : Dog and Cat Paper Gift Boxes - Lines Across

CAT paper analysis Server glitches in today's CAT paper cat question paper with solutions CAT exam today at Mumbai's Thakur College, Kandivali centre was riddled with problems.

The beckoning cat is supposed to bring luck and wealth. This one can actually move its arm. Here is a video: The underlying mechanism is actually quite simple and consists mainly of a small paper pendulum with a coin as weight. Here are some more pics of the assembled cat: I have to admit this was the most difficult model to design so far, and it is quite tricky to build – especially the mechanism for the arm. You have to pay attention to allow the arm to rotate freely. Any friction will cause it to stop rocking back and forth. In addition, the whole model is a bit complex for beginners, and it is important to build everything in the right order – otherwise you may paint yourself into a corner. Here is a photo tutorial: Start with the mechanism for the arm. In order to keep things nice and clean, this is a standalone contraption that later goes inside the actual cat body. Here are the parts: First, build a holder: Now assemble the left arm. The arm is a bit complicated, therefore I have made a video tutorial for it: Begin by putting together three sides of the arm, but leave one side open yet: There is a small square with a hole in the middle. This goes into the upper arm and is intended for holding and stabilizing the stick that later will hold the arm in place. Take a wooden stick about 3 mm in diameter, wooden skewers are perfect. Insert it carefully into the arm, like so: Now glue the missing face to the arm. Then insert it carefully into the holder: Make sure it rotates freely, without any friction. Shorten the skewer so that it is a bit longer than the holder. If it is too long, it will not fit into the body, so be careful. Next, assemble the head: First, take the largest part and glue it into a helmet shape: Now take the two smaller parts and glue them together. This will form the face: Then attach the ears: Ok, onto the final part – the body. In a first step, build the front half only, starting with these parts for the right side and hind leg: Continue with the front: You will end up with something like a hemisphere: Now glue this hemisphere onto the base plate: Now place the holder for the arm into the body. Align the ring with the hole for the arm, then glue the holder to the base plate and the ring to the hole – this will ensure that the arm is firmly centered in the hole. Now you can insert the arm: Ensure that the arm can rotate freely. Then lock the skewer in place by glueing the small disk to the end. You will need a small coin as a weight: Make sure that the arm is in the right position upwards when the weight is attached. Also, test that everything works smoothly. The arm should swing back and forth when you tip it. If everything is ok, you can glue the backside in place: Alright – almost there. The only thing left is to attach the head, and you are done: Here is the template:

History[edit] Before , CAT was a paper based test conducted on a single day for all candidates. The pattern, number of questions and duration have seen considerable variations over the years. The American firm Prometric was entrusted with the responsibility of conducting the test from to Exam format[edit] The Common Admission Test CAT , like virtually all large-scale exams, utilises multiple forms, or versions, of the test. Hence there are two types of scores involved: The raw score is calculated for each section based on the number of questions one answered correctly, incorrectly, or left unattempted. No points are given for questions that are not answered. The raw scores are then adjusted through a process called equating. Equated raw scores are then placed on a common scale or metric to ensure appropriate interpretation of the scores. This process is called scaling. Since last two years, the structure of the test has undergone a few changes. CAT is a computer-based test which consists of objective type questions. There are 3 sections in the test: Before this, the distribution of questions was different. In CAT , it is expected that a number of questions in each section may vary as compared to the previous year. Exactly 60 minutes will be allotted for answering each section. Each question carries 3 marks and there is negative marking of 1 mark for each wrong answer. No negative marking for non-MCQ type questions. A virtual calculator on-screen calculator will be available throughout for the purpose of calculation. The test takers cannot switch between the sections and have to attend the test in a particular order. As the three sections evaluate distinct sets of knowledge and skills, scores do not correlate across sections. A high score in one section does not guarantee a high score in another section. Percentile rankings are provided for each individual section as well as for the overall exam score. CAT registrations in numbers over the years[edit] The number of registrations in the past years are shown in the following chart: Number of registrations in CAT over the years [12] Year.
