DOWNLOAD PDF DREAMWEAVER CS3 TUTORIAL ESPAÃ'OL

Chapter 1 : Adobe Dreamweaver CS3 Portable - Kuncoro Cyber

N.B: The most important step you need to take every time you launch Dreamweaver CS3 is to define your Local Info. The "local root folder" is the name for the folder where.

Dreamweaver generates standards-compliant code for your website which means your website will not become "broken" every time a new version of a web browser is released. This tutorial guides you through the steps of creating your first website using Dreamweaver. The tutorial assumes that you are using Dreamweaver CS3. For the most part, both versions work in the same way. A Web Hosting Account You will need a web host to publish your pages to. For the complete beginner, a web host is loosely speaking a company which has computers that are permanently connected to the Internet. There are numerous web hosts around â€" you can find a list of cheap web hosts on https: This tutorial however does not deal with those matters â€" it is strictly about designing creating and publishing uploading your website using Dreamweaver. Overall Goals of the Dreamweaver Tutorial By the end of this tutorial, you will have set up a working website with multiple pages, including a main page, a feedback form, an About Us page, and a Site Map. Your pages will contain a sophisticated navigation menu bar, images, multiple columns, a form, links to other pages within your site, links to other sites, text in different font sizes, etc. In other words, you will have a fully functional website. More importantly, you will know how to use Dreamweaver to create, design and publish your site so that you can design new sites any time you want. Goal of this Chapter In this chapter, you will learn to create a rudimentary two-column web page like this web page that you are currently reading and publish it so that it can be accessed on the Internet. By the end of this chapter, you will be viewing your web page on the Internet with your favourite web browser. Note that this is a hands-on tutorial. To benefit from it, in fact, to even understand it, you need to follow the steps as I describe them. You will be greeted with a window with a top-half looks something like the picture above without the words "Dreamweaver Tutorial thesitewizard. Click the "Site" menu item on the menu bar. A drop-down menu will appear. Click the "New Site The number that follows the word "Site" may be different if you have ever used Dreamweaver to set up a site before. We are about to change it anyway. At the top of the dialog box is the "Basic" tab. If it is not currently selected, click on it to select it. In the edit box for "What would you like to name your site? If you are not sure what name you want for your site, use your domain name. For example, if you have purchased a domain called "example. For the purpose of this tutorial, I will assume that you have typed "Example Company" in the box. For example, if you bought the domain "example. Click the "Next" button at the bottom of the window to proceed to the next screen. Accept the default "No, I do not want to use a server technology" for now. Click the "Next" button again. The next screen allows you to define where Dreamweaver saves the files you create. The default is to place the files in a folder with the same name as your website. You can change the location if you wish. Note that this folder merely determines where on your computer the website files are saved. You will be taught how to publish those files to your web host in a later step. It is always good practice to keep a copy of your website on your own computer. When you click "Next", you will be asked "How do you connect to your remote server? For now, select "None" in the drop-down box and click "Next" again. You will then be given a "Site Definition" summary. For the purpose of this tutorial, we will be creating a two-column web page for the main page. A two-column web page basically means that the page will have two vertical columns. For example, on thesitewizard. That is, click the "File" menu followed by the "New" item on the menu that appears. A new window entitled "New Document" will appear. Look in the "Layout" column in the window that appears and locate the item "2 column liquid, left sidebar, header and footer". Select the item by clicking on it once. Look at the rightmost side of the same window and locate the item "Layout CSS". Click the drop-down box and select "Create New File". This will cause Dreamweaver to save certain types of information about the appearance of the web page called CSS in a separate file. One of the ways in which this is useful is that when we design other pages of the site, we can reuse the same information by simply loading it from the same file. Click the "Create" button. A dialog box entitled "Save Style Sheet As" appears. Accept the default name and location by simply clicking the "Save" button. Dreamweaver now presents you with a

page with two columns with some dummy content typed in. We will be replacing some of the dummy content with our own content. Designing the Home Page: For example, if your domain is called "example. A home page typically contains brief information about what the site is about as well as links to the other pages of your website. If this is the home page of your personal site, you will probably want to welcome your visitors and mention briefly what they can hope to see on your site. For the purpose of this tutorial, I will provide example text for a fictitious company called "Example Company", selling some fictitious products. You should of course use your own text rather than my supplied text. Likewise if you are creating a personal website, and you are out of ideas as to what to call your site, call it by your name. You will see that there is a band spanning the entire top row of the page. The words in that band currently read "Header". Below that there are two columns: All the text that is given in the window can be replaced by your own content. To replace the content, simply click on the word you wish to replace, delete it and type your own. The first thing you should do is to replace the word "Header" with the name of your website. To do this, click somewhere in the word "Header". A blinking text cursor will appear. Using the delete or backspace key as needed, delete "Header". Type the name of your website. Directly above where you typed to replace the "Header" text is a small edit box with the words "Untitled Document". Click the word "Untitled". Use the delete or backspace key to remove the existing text and replace it with the name of the site you typed earlier. This will be the text that the search engines show for this web page when it displays the results of a search. You should now replace all the text in the right column with your own text. Simply click on the "Main Content" title and replace it with some appropriate content. You can take a look at the text that I will be using below as an example. Typing and editing of text within the page works more or less like it does under a wordprocessor. Repeat the process with the "H2 level heading" subtitle and the words that follow. Just replace it with whatever you want your website to display. If you want, you can replace the words with the example text below. Welcome Example Company deals with all manner of examples. We have examples of literary works, pulp fiction, text books, movie reviews, scripts, chairs, tables, household appliances, and so on. We even have examples of examples. Featured Product Dreamweaver Site: This is an example of a Dreamweaver site, created with the help of thesitewizard. The tutorial teaches you how to create a basic but fully-functional website which you can modify and augment to suit your needs. Leave the left column sidebar alone for now. We will add a navigation menu to this section in later chapters of this tutorial. Scroll down to the bottom of the page and replace the word "Footer" with anything you wish to put at the bottom of the page. For example, you can place your copyright notice in place of this word. Once you are satisfied with your page, click "File Save As A dialog box will appear asking you where to save the page. Be sure to type the name "index. When you publish that page to your website at say http:
