CP3 and King 3. These are small electric powered radio control model helicopters. Micro electronics and battery developments have allowed for these small lightweight helis to become affordable to anyone wanting to get into the hobby. The new Honey Bee helicopter is a transformation from its predecessor. Aimed at the beginner RC helicopter flyer, it still offers great fun flying for more experienced pilots. The new Honey Bee King 3 now comes fitted with an updated 6-channel radio control system and advanced head locking gyro. The more maneuverable designs are often harder to fly, but benefit from greater aerobatic capabilities. Esky renamed the E version in Dec to. Once you have your new Honeybee and have read the manual while the battery is. When making your choice its important not to over- estimate your own skill levels. If you are a complete novice, its best to start with the fixed pitch Honey Bee model as this will require less set- up and be less sensitive to control inputs or over- inputs! The basic controls of these model helicopters follows the standard layout. In addition the 6 channel models allow you to alter the pitch of the main rotor blades - this can be done by mixing the motor control and blade pitch control together - giving a much more dynamic response from the helicopter. The various helicopter controls are effected by means of small servos. A gyro is used on the tail rotor control to counter wind and torque reaction induced tail movement. Honey Bee King 2 Parts. Product Compare 0 Show: Default; Name A - Z. This adjusts the control signal to the tail rotor motor or servo - preventing spinning about the axis and leaving the pilot to control the direction the model moves. Power is provided by electric brushed or brushless motor. This is connected through the speed controller to a lithium polymer Li. Po battery which is both powerful and lightweight. Micro helicopters can range in price from as little as. The CP3 version, although still reasonably priced for a 6ch helicopter, be prepared to spend some money on spares as you get to grips with its more responsive performance. The larger Honey Bee King 3 model may be more expensive initially but comes with more advanced features and complex build offering greater control and stability. This is the model to go for if its within your budget. Another great thing about the Honey Bees is the scope to upgrade the component parts. All models have upgrades available both from the Esky factory and from specialist suppliers like Xtreme. Parts available include blades, cnc aluminium, and carbon fibre. With the King 3 its also possible to attach a digital video camera like the Fly. One - great for aerial footatage or just spying on the neighbours!

Cycle Notation for Permutations. A more streamlined way to display permutations is by the use of cycle. To illustrate how this works, consider the permutation $\sigma = (1\ 2\ 3)$. An r -cycle is denoted by $(i_1\ i_2\ \dots\ i_r)$. Theorem A permutation on a finite set A is either a cycle or can be expressed as a product composition of disjoint cycles. Proof is by strong induction on the number, r , of points moved by a permutation. Assume result true for all $r < n$. The number of cycles in σ is $n - r + 1$. Thus, σ has the same parity as r . We can describe permutations by prescribing the image for every point, for example. In practice, however, we will write permutations in cycle notation, $(i_1\ i_2\ \dots\ i_r)$. Some permutations have more than one cycle. For example, the cycle notation for the permutation corresponding to: Let S be a set. A permutation of S is simply a bijection $f: S \rightarrow S$. The cycle type is $(2, 3)$. As promised, it is easy to compute the order of a permutation, given its cycle type. Let σ be a permutation, t common. The above two-row notation is quite inefficient and also difficult to understand the permutations in great detail. For example, the permutation $\sigma = (1\ 2\ 3)$. It would be nice to have a more efficient way to describe this element ideally one which misses out. Note that in fact a cycle (a) of length one is the identity it takes a to a and leaves all other elements fixed too. We shall prove that every permutation is a product of disjoint cycles cycles no two of which contain a common element but first we look at some examples. Let us introduce the cycle notation. We write $(1\ 2)$ to mean that 1 is sent to 2 . With this notation, we write $\sigma = (1\ 2)(3\ 4)$. This group is isomorphic to $C_2 \times C_2$, and it is abelian. We can combine two such permutations:
