

Chapter 1 : Hyperion Tutorial Trainings Reporting Analysis Documentation Information

Financial Reporting - Tutorials The Oracle by Example (OBE) series provides step-by-step instructions on how to perform a variety of tasks. The Oracle by Example series reduces the time spent investigating what steps are required to perform a task.

It has excellent multi-dimensional reporting capabilities and scales very well unlike Web Analysis. Part of the reason for this is, there is not much metadata management that is required for HFR only reporting metadata. It has extensive formatting capabilities similar to BI Publisher and also supports multi-dimensional hierarchical drills, hierarchical prompts etc. The major drawback of HFR up until 9. It did not support reporting directly on relational sources. In fact, based on my testing so far this works much better than the existing BI EE " Essbase connectivity. If you are not sure about what XOLAP offers and its advantages, refer my previous blog entry on this here. All the design considerations in terms of outline structure etc would have to be adhered to even in XOLAP. So we start with importing the required database tables from within Essbase studio After importing the required tables, we establish the relationship across the tables using the normal SQL Joins After establishing the relationships, we need to define the Hierarchies and Measure Hierarchies in Essbase Studio. There will be one Accounts dimension which will have all the relational measures. Deploying this to Essbase should create a new application and database. The only difference is, this cube will always return data from relational sources at run-time. There will not be any pre-aggregated data stored in this cube. So, we basically have an outline that is directly dependent on relational source. Of course, not every MDX function is supported As there is no corresponding equivalents ones in the relational source. Then i create a very simple grid in HFR with the following layout. The idea is, i will enable the drills on the Product and Time dimensions. The POVs will act as hierarchical prompts just for this example. If you notice, we can now leverage XBRL directly here. In the report, you can see that the drills are context sensitive. Even they are hierarchy aware. Hardware is one level above the Deluxe Mouse member. But this kind of calculations are quite common when dealing with Essbase sources As you see, custom financial reporting functions work quite well. This is actually quite exciting Atleast for me to see a web based reporting solution which is in the strategic direction of Oracle from Oracle that can do multi-dimensional aware reporting on relational sources. All the complex formatting that we are so used in HFR will all work here as well. Atleast until 11g comes out this can quite easily serve the reporting needs of multi-dimension aware reporting on relational sources. I will cover that as a separate blog entry.
