

Chapter 1 : Mariusz Tarkawian: Anticipating the Future

People working in organisations embracing this mindset rather than forecasting an 'uncertain' future, prefer to act to anticipate it. These companies don't rely on structure but upon action through the implementation of a set of projects.

Stay ahead of technology paradigm shift 08 Dec Technology Trends of With breakthroughs for promising technology and rising popularity of blockchain, businesses often fail to keep up with rapid pace of technological evolution. But with more than 3, exhibitors, CES is still a place where you can find the latest technology trends. Here are some things we expect to see at CES this year. With massive investments in IoT for urban systems, several cities in Europe have already reaped enormous benefits. Smart cities and the Internet of Things IoT are spearheading us to new era of urban living and development. The focus is now toward the quality of life for residents, workers, and visitors living in urban cities. By exploring where organization can contribute in the ecosystem of a Smart Cities, business owners can work ahead of the curve by looking for ways their brands can actively support and contribute to a Smart City, ultimately playing a larger role in an emerging trend. Seamless conversation Few years back, voice search was considered unreliable. Fast forward today, voice research is becoming flawless with new speech recognition software getting better and better at recognizing human speech. With chatbots becoming more intelligent, stimulating persuasive conversations with customers, seamless conversation will be the act of future. But as we noted in our discussion of the future beyond a smartphone there are other ways to interact that could be useful. Face recognition can also be used by smart vehicles to recognize its owners for unlocking doors, opening trunks, and more. Emerging Mobile App Development Trends Check technology trends to compare with trends catching up in We live in the age powered by technology, where waking up to a newspaper headline boosting a technological advancement or version update does not come to us as a surprise. Needless to mention, immense efforts of technology giants to bring forth the best possible software and gadgets to people has contributed to increased acceptance of tech devices among common people. In this technological era, what you serve to people is definitely important, but along with that, how you serve carries an equal weightage. Technology companies have mastered this area and revolutionized major industrial sectors including information technology, mobile app development , retail, ecommerce, healthcare, entertainment, web development and media. Other than this, thousands of Virtual Reality based games and apps have seen entering the market off lately. These games have managed to entertain players to the core, who demand for more games built on the same lines with enhanced graphics and virtual reality experience. These signs are a clear indication of rising trend of AR and VR concepts. Tractica Mobile and even web users are getting used to bots that understand your usage pattern, learn from it, make predictions and assist you in every possible task with their artificial intelligence. Natural language processing, deep learning and neural networks are being studied in depth to explore its limitless possibilities. Mixture of advanced algorithms and parallel processing power can lead to a brighter tomorrow. Internet of Things IoT Take a look at the graph below showcasing the rising concept of Internet of Things with number of connected devices worldwide from to Smart Home is a dream come true to a certain extent. Though there are few limitations to this technology as of now, which will be set loose with more advancements in this sector. Millions of apps and thousands of appliances we use in our daily lives can work wonders when associated with a common thread. Amazon, Google and Apple are in the research phase of making the most of these things by connecting them using Internet of Things concept. Once implemented successfully, Internet of Things is going to spoil common people for convenience and flexibility at its best. Situationalintelligence With the world going digital, dealing with large data sets is obvious. Analyzing and testing being the major game changer for any business, Big Data development has off lately saw a lot of improvement. User behavior analytics and predictive analytics are used to extract the information required for carrying out business operations and optimize them for good. Big data analytics make it possible to easily retrieve data, as per your needs and as and when required. Automation will be a remarkable year with the craze for automation only going up, showing no sign of slowing down. The combination of machine learning and automation has the power to give rise to a completely new age. The

number of tasks carried out manually will be reduced by , with automation coming as the new ruler of the IT market. Physical and Digital Joining Hands Online shopping for grocery, clothes, footwear, internet banking, online ticket booking and online payments are all byproducts of digitally powered world. Experts say that, though this digital world is beautiful, it can be made more awesome by integrating elements of physical world into it. As the idea has potential to grow, ecommerce businesses have started endeavor to include options of physical store such as Dash Buttons to serve customers better and better each day. The same goes true vice versa too. For example, traditional stores would be including digital features such as store map for easy accessibility of required products to customers. Get ready to experience the best mixture of physical and digital worlds. On-Demand Services Do you want food to be delivered at home or want to book a cab to go office? Get it done in few clicks. Whatever be your requirements, it can be fulfilled with mere taps on the screen of mobile phone. Mobile app development industry has grown by leaps and bounds, having built an app for any task. This has spoiled mobile phone users to avail any kind of service. People have responded quite positively to these on-demand services, which further encourage its growth in the coming year. What do you think about these emerging trends? These predictions are made by technological experts, which means there is some strong base to it and not completely futile. There can be additions to the list of trends, but the ones mentioned above are sure shot to garner attention in the coming year. This forecast can help you to plan future business and corresponding marketing strategies. The list helps you to focus on key areas that will become more famous in future in a better way. You can even hire resources having specialization in these technologies to work on it dedicatedly. Preparing now is the right time to dominate the future, far outweighing your competitors.

Chapter 2 : TimberWest Magazine January/February - Woody Biomass " Anticipating the Future

January 24, By Michael Cupo Leave a Comment What the anticipation of the future causes is the inability to live and enjoy what is happening right now. The more one enjoys now, the less there will be a need to anticipate the future as a refuge. Think of this, you book a vacation to a tropical island, but it will be three months before you actually go. The anticipation incurred will be dependent on how much your mind is allowed to drift to use the future to bring in a feeling of happiness. As the vacation date gets closer, the undisciplined mind will go to that future date more and more. It will make up the story of how much the vacation is needed and what a good time you will have. It will constantly go to that date and make you wish that you were going now. Your mind will make you use so much energy on anticipating this date, it will be hard to focus on what is going on right now in your life. You will look upon the vacation over and over as your refuge. So now after much anticipation and wishing the date was closer, it is now here. You are finally going on vacation. You booked a seven day vacation and on the first day you are thoroughly enjoying yourself, because you know you have six days left. On the third day it is still great because you have four days left before you are to return home. On the fifth day you start thinking about how there are only two days of vacation remaining. It is now the day before you are to return home and you wish you had at least a few more days of vacation to enjoy. You have now returned home and tomorrow you are to return to work. The next day you are back on the job and in two hours it almost feels like you never left. By the end of the day you are back into full work mode and the vacation is an after thought. After a week goes by you now try and bring last weeks vacation into the present to make you happy. With so much anticipation, much of the life you are given passes you by. If you are waiting for this or that to happen before you truly enjoy life, you will probably die before it occurs. If not you will probably miss most of your given life, because of either anticipating something you wish you had now, or trying to recapture something from the past you once had.

Chapter 3 : 6 Things You Should Do to Anticipate the Future – Life Optimizer

Anticipating the supplement market trends can be easier with StockNutra! Real products, unbeatable pricing & fast shipping. See prices and inventory in real-time.

In such kind of world, our ability to anticipate the future is very important. Those who can anticipate the future will have more time to prepare and thus will be ready when changes come. Since they become among the first few people who are ready, they can reap the greatest benefit of the new trends. Most people will come only later when the best parts have already been taken. This is an important part of being a versatilist see *Be a Winner by Being a Versatilist: What, Why and How*. But how do we build the anticipation engine? The bottom line is you should be able to see how the dots are connecting. See how the dots are connecting in the past and present, and then project them into the future. This is how you anticipate the future. So here are 6 things you should do: First of all, you need to read smart about the past. This is important to allow you see how the dots connected in the past. Since your goal is seeing how the dots connected, your readings should be those which are concerned with getting the patterns of history instead of just telling historical events. It does exactly what we want: Read smart about the present After seeing how the dots connected in the past, you should see how the dots are connecting in the present. Here you should be able to recognize patterns in our present world. This is important not just to anticipate the future, but also to see whether or not you are ready to face the present challenges. This part should give you immediate benefit because the actions you take will directly affect how you perform in the present. Read smart about the future The next thing is of course seeing how the dots would connect in the future. Since they are still in the future, what you see are still possibilities, not certainty. But you do need to know what the possibilities are. Be careful when reading about the future though. My favorite book for this is *Visions* by Michio Kaku. It clearly describes what scientific achievements are predicted to occur in the 21st century and beyond, and how they will affect our life. Read smart about how trends evolve Now that you have got the big picture of the past, present, and future, you should learn how one dot connects to the next. It talks about how social epidemics work, and the knowledge you gain from the book may help you spot the clues of coming social epidemics. Do content analysis You can spot trends by doing content analysis. You do content analysis by analyzing the content of the media such as magazines, newspapers, movies, and books. See what are currently popular and why. Seek the patterns of what is going on behind the content you analyze. After reading smart about the past, present, and future, and learning how trend evolves, you should know enough to look for the patterns behind the content. Books like *Megatrends* by John Naisbitt are built upon content analysis. While the first four steps prepare the framework the big picture , content analysis fill in the details. Project the dots into the future Now that you have got the big picture and the details, you should have enough information to project the dots into the future. The clues of coming trends should be here and there in your content analysis, and your understanding of the big picture should help you recognize and connect them. You can then see your current situation to see which coming trends are most likely to influence you and take the necessary actions to prepare yourself. The resources I mention above are the best resources I know. Do you know of other good resources to help us anticipate the future? Feel free to share them in the comments.

Chapter 4 : Seniors, Part 3: Anticipating the Future | Senior Citizen Journal

Anticipating the Future January 24, By Michael Cupo Leave a Comment What the anticipation of the future causes is the inability to live and enjoy what is happening right now.

Related link pages Insights into History "The value of history is, indeed, not scientific but moral: Attempting to understand the past Why did people live in tribes and city states in the distant past? What changes led to Human Beings - whose ancestors had lived in tribes and city states - living in future in the feudal monarchies and dynastic kingdoms and empires of "Middle Ages" Europe? Attempting to study history in order to understand the present Why do people tend to live in republics and constitutional monarchies today? What changes have led to Human Beings - whose ancestors had lived in feudal monarchies and dynastic kingdoms and empires - living, at present, in republics and constitutional monarchies? How far is it possible to realistically attempt to anticipate, plan, be better prepared for or shape the future? It is remarkable that most men read little History. Even scholars, whose business it is to read, complain of its dullness. This fact may suggest that it is not rightly written for it should, should it not? Correspond to the whole of the mind, to whatever is lovely and powerful. No man can think that this all-containing picture if seen in good light could be devoid of interest. There can be no true history written until a just estimate of human nature is holden by the historian. The eye of those who have written our annals is not fixed at a point of sufficient elevation to command the whole prospect of humanity. They magnify appearances, measure by vulgar standards; and in their solicitude to expose the events which have made the most noise omit the most pregnant and silent revolutions. Every body can see when a coronation takes place, or can write down the result of a battle; but a change in the philosophy of the learned class, a loss of religious faith in the majority of a nation, which are revolutions and which prescribe the course of affairs for centuries to come, not everyone can see. What a saint has felt he may feel. What has at any time befallen any man, he may understand. He that purges out of his thought every vestige of personal limitation and respire the air of pure truth will speak or write or do what is durable, what is intelligible to all times and countries. Of this mind the events of history are the work. Its constitution is illustrated by the entire series of days. Man is explicable by nothing less than all his history. Without hurry, without rest, the human spirit goes forth from the beginning to embody every faculty, every thought, every emotion which belongs to it, in appropriate events. But always the thought is prior to the fact. All the facts of history preexist in the mind as laws. Each law in turn is made by circumstances predominant, and the limits of nature give power to but one at a time. How, then, to set about gaining an appreciation of human nature??? Journal entry of December, Our neighbours are occupied with employments of infinite diversity. Some are intent on commercial speculations; some engage warmly in political contention; some are found all day long at their books € This dates from January - February, The Religions of the World and Tripartism Buddhism and Hinduism also more properly known as Vedanta , are generally considered by Westerners to be particularly philosophical. Like water on a lotus leaf, or a mustard seed on the point of a needle, he who does not cling to sensual pleasures - him do I call a holy man. He who in this very life realizes for himself the end of suffering, who has laid aside the burden and become emancipated - him do I call a holy man. He who has profound knowledge, who is wise, skilled in discerning the right or wrong path, and has reached the highest goal - him do I call a holy man. He who holds aloof from householders and ascetics alike, and wanders about with no fixed abode and but few wants - him do I call a holy man. He who has renounced violence towards all living beings, weak or strong, who neither kills nor causes others to kill - him do I call a holy man. He who is friendly amidst the hostile, peaceful amidst the violent, and unattached amidst the attached - him do I call a holy man. He whose lust and hatred, pride and hypocrisy have fallen off like a mustard seed from the point of a needle - him do I call a holy man. They come and they go, they are transient: But he who on this earth, before his departure, can endure the storms of desire and wrath, this man is a Yogi, this man has joy. He has inner joy, he has inner gladness, and he has found inner Light. This Yogi attains the Nirvana of Brahman: Holy men reach the Nirvana of Brahman: Because the peace of God is with them whose mind and soul are in harmony, who are free from desire and wrath, who know their own soul. It is possible to

detect a suggestion of "Tripartism" in this teaching. Again Jesus began to teach by the lake. He taught them many things by parables, and in his teaching said: A farmer went out to sow his seed. As he was scattering the seed, some fell along the path, and the birds came and ate it up. Some fell on rocky places, where it did not have much soil. It sprang up quickly, because the soil was shallow. But when the sun came up, the plants were scorched, and they withered because they had no root. Other seed fell among thorns, which grew up and choked the plants, so that they did not bear grain. Still other seed fell on good soil. It came up, grew and produced a crop, some multiplying thirty, some sixty, some a hundred times. How then will you understand any parable? The farmer sows the word. Some people are like seed along the path, where the word is sown. As soon as they hear it, Satan comes and takes away the word that was sown in them. Others, like seed sown on rocky places, hear the word and at once receive it with joy. But since they have no root, they last only a short time. When trouble or persecution comes because of the word, they quickly fall away. Still others, like seed sown among thorns, hear the word; but the worries of this life, the deceitfulness of wealth and the desires for other things come in and choke the word, making it unfruitful. Others, like seed sown on good soil, hear the word, accept it, and produce a crop - some thirty, some sixty, some a hundred times what was sown. He said to them, "Do you bring in a lamp to put it under a bowl or a bed? For whatever is hidden is meant to be disclosed, and whatever is concealed is meant to be brought out into the open. If anyone has ears to hear, let them hear. For I presume the state has not received them from any other source. It would be ridiculous to imagine that the presence of the spirited element in cities is not to be traced to individuals, wherever this character is imputed to the people, as it is to the natives of Thrace, and Scythia, and generally speaking, of the northern countries; or the love of knowledge, which would be chiefly attributed to our own country; or the love of riches, which people would especially connect with the Phoenicians and the Egyptians. This then is a fact so far, and one which it is not difficult to apprehend. No, it is not. But here begins a difficulty. Are all our actions alike performed by the one predominant faculty, or are there three faculties operating severally in our different actions? An enthusiasm that was to remain with him for several years. In a letter to his brother William Emerson, who was a lawyer, written on May 24, , Emerson wrote: Have you not read it? What is the business of history? What is the stuff of which it is made? Who is the personage of history? There are many different elements in history. Evidently again, the elements of human nature. History is therefore the development of humanity, and of humanity only; for nothing else but humanity develops itself, for nothing else than humanity is free. Assuredly we shall have made great progress towards the attainment of our object, when we shall know beforehand all the pieces which compose the machine whose play and operation we would study. Moreover, when we have all the elements, I mean all the essential elements, their mutual relations do, as it were, discover themselves. We draw from the nature of these different elements, if not all their possible relations, at least their general and fundamental relations. We must begin with seeking the essential elements of humanity, and proceed by deriving from the nature of these elements their fundamental relations, and from these the laws of their development; and finally we must go to history and ask if it confirms or rejects our results. If it confirms them, if experience reproduces the speculations of thought, it will follow in the first place, that we have entered upon a path which leads somewhere, History would no longer be a series of incoherent words, succeeding each other in a certain order we know not why; it would become an intelligible phrase in which all the words, presenting some idea, would form together one whole, which would completely express some definite meaning. Hilliard, Gray, Little and Wilkins, , pp. The value of history, then, is that it teaches us what man has done and thus what man is. Collingwood Emerson continued to be under the formative influence of Victor Cousin, to some degree or other, for some six or seven years after Emerson had come to see particular importance to a rounded appreciation of Human biographical experience to a full understanding of History. All its properties consist in him. All history becomes subjective; in other words, there is properly no history; only biography. Every mind must know the whole lesson for itself, -- must go over the whole ground. What it does not see, what it does not live, it will not know. If we can accept that everyone [regardless of gender], to some extent or other, has capacities for Honesty, "Manhood" and Good Fellowship we can further tend to accept that such characteristics would be suited to individuals functioning as members of such social groups as tribes or other communities such as city states. Individuals might, more

often than not, be honest and somewhat spiritual, be prepared - should circumstances require it - to help to defend their tribe or city state, and also tend to enter into social and personal relationships and engage in productive activity related to household tasks, hunting, gathering, agriculture, the fashioning of tradable items and the provision of marketable services. As pre-history transitioned into history tribal life was viable in that tribal social groupings could be self-sustaining allowing members of the tribe to participate, from the time of their birth, in a society which sought to offer protection to its members and to co-operate in the tasks necessary for communal survival. As time passed there were domestications of crops and herds, increased skill in the fabrication of artefacts such as clothing, bows and arrows, and storage pots. Very gradually peoples began to gain skills in copper, bronze and iron metallurgy. As yet more centuries rolled by city states proved to be increasingly viable.

Chapter 5 : Looking to Anticipating the Future of Higher Education | The EvoLLLution

A New Framework for Anticipating the Future Roger L. Caldwell, Professor Emeritus, University of Arizona Updated January 25, Introduction.

Richard DeMillo Director of the Center for 21st Century Universities, Georgia Institute of Technology By expanding the strategic planning horizon from 10 to 20 years, Georgia Tech is positioning itself to meet the changing demands of postsecondary students, institutions and employers for years to come. Using the year as a long-term vantage point, Deliberate Innovation makes recommendations on alternative educational models to reduce costs, improve the effectiveness of current methodologies, and increase opportunities to serve the needs of the next generation of learners. In this interview, Rich DeMillo, who co-chaired the Commission on Creating the Next in Education, discusses the future of higher education, and points to why institutions need to expand the scope of their strategic planning initiatives to meet the challenges of a rapidly changing industry. Why is it important to envision a new future for higher education? Typically, universities and colleges plan on a five- or ten-year basis, analyzing contemporary forces causing industry change to anticipate what the impact of those changes will be on the college ten years in the future. This allows us to make strategic investments to meet anticipated challenges. The nature of students is changing. The nature of the workplace is changing. The science of learning and teaching is changing. Fundamentally, society is changing at an unprecedented rate. A few years ago, we realized that unless we started to have those conversations about what the world and our industry will look like in , we were not going to be able to give our successors a set of investments that were going to carry them into the future. What does the more lifelong vision for education shared in Deliberate Innovation, Lifetime Education mean for the structure of the education ecosystem and the place of postsecondary institutions? When we were conducting research for our report, we were told by specialists that the K view of the world is shrinking: What we used to think of as the gap between high school readiness and the freshman experience is being replaced by something else. As we began to think about that, the idea that there were natural boundaries between the spheres of education became far less relevant. We now know that we are going to have to engage learners much earlier, and engaging early learners is very different from engaging year-old high school graduates. We have to think about erasing barriers on the older side, too. We know that Georgia Tech graduates are entering industries where the pace of change is accelerating. In our report, we call this the churn of knowledge. What do they need to know when the fundamentals of their industry shift out from underneath them? We understand undergraduate education, but we have to learn more about other two bookends: Are you envisioning that the institution itself will start to serve these audiences directly rather than through CE? We anticipate that future learners are not necessarily going to be looking for degrees. At the younger extreme, the world is very complex. A high school sophomore is already confronted with so many more choices than we had at their age. Who is going to be their trusted advisor to help them navigate all of their options? Managing that complexity is beyond what the current system of higher education can handle. We envision that higher education will bear a responsibility for supporting that population of learners throughout their educational journey. For the last years, higher education has focused all of its attention on delivering quality educational experiences to to year-olds, but that is a shrinking population. Fewer and fewer of them are choosing to pursue higher education. They were working year-olds with families in California. That entire population of unservednot underserved, but unservededucational consumers hit us like a ton of bricks. It really was a driving force behind why we started looking at how we might package new educational products. What are a few critical steps that higher ed administrators need to take in order to prepare institutions for this new vision of lifelong postsecondary education? We wanted to investigate how technology can help us scale personalized consultation, advising and counseling services. As we move into K, more and more learners will be looking for that kind of trusted advice. Second, we must invest in the technology needed to make that happen. That layer of research has been very important. What services should be available to students around the world, and what will the business model be for delivering them? It will be much more organically embedded in global communities, and attuned to the needs of the people who

are attending Georgia Tech. How do employer and government approaches to higher education need to evolve to facilitate that shift in what students are looking for and what institutions are capable of delivering? These are the types of things that employers are asking for. Those are immersive experiences that develop the kinds of skills that employers are telling us are going to matter. It makes sense to provide students with the skills to adapt to change after they graduate. From a government perspective, how do approaches to tuition assistance and financial aid need to evolve to make sure that learners have access to affordable programs that are recognized by stringent quality control standards? First off, the trend towards MOOCs will continue moving forward. Beyond that, the productivity increases that you get by using technology actually brings down costs for everyone. Every time we unbundle a set of services that we normally think of as a single product and break it into component parts that people can pick and choose from, it positively affects affordability. Finally, the marketplace will determine the quality of educational products, rather than third-party accreditors. This will have some real cost advantages. At a research university like Georgia Tech, people think very hard about how to structure their research programs to anticipate future needs, but they spend relatively little time thinking about how to innovate on the academic front. We want to create an immersive culture where all of the incentives and all the rewards flow to individual institutional leaders and faculty members who are consciously rethinking how to deliver education. This idea of deliberate innovation comes from a branch of organizational psychology that has done fairly deep thinking about anticipating needs in order to keep ahead of rapidly changing environments. This interview has been edited for length and clarity.

Chapter 6 : Understanding the Past and the Present, study history to anticipate the Future

Chapter 9 : Anticipating the Future | Spiritual Writers Network

Anticipating the future has always fascinated people. We should all be on hoverboards and wearing silver according to past thoughts, however the reality is that technology is evolving faster than humans and if we don't keep up by focusing on what actually matters in education, then our children may well struggle.
