

Chapter 1 : How listening to your customers impacts the bottom line | Oracle Marketing Cloud

*Listening to the Oracle; The Ancient Art of Finding Guidance in the Signs and Symbols All Around Us [Dianne Skafte] on racedaydvl.com *FREE* shipping on qualifying offers. A spellbinding book offers a historical and psychological tour of the tradition of seeking and receiving oracles--messages of guidance and illumination from a source beyond the conscious self.*

If the client connect descriptor uses the SID parameter, then the listener does not attempt to map the values. This parameter is primarily intended for configurations with Oracle8 databases where dynamic service registration is not supported for dedicated servers. This parameter may also be required for use with Oracle8i and later database services by some configurations. Without this setting, the listener assumes its Oracle home for the instance. On Microsoft Windows, this setting is ignored. To statically configure the listener, do the following: Select Listeners from the Administer list, and then select the Oracle home that contains the configuration files. You may be prompted to log in to the database server. The Listeners page appears. Select a listener, and then click Edit. The Edit Listener page appears. Click the Static Database Registration tab, and then click Add. The Add Database Service page appears. Enter the required information in the fields. You can also configure static service information with Oracle Net Manager. The following example shows an excerpt of a listener. As a policy, the listener can be administered only by the user who started it. This is enforced through local operating system authentication. For example, if user1 starts the listener, then only user1 can administer it. Any other user trying to administer the listener gets an error. The super user is the only exception. Oracle recommends that you perform listener administration in the default mode secure by means of local operating system authentication , and access the system remotely using a remote login. Oracle Enterprise Manager can also be used for remote administration. Configuring and Changing the Oracle Net Listener Password Local administration of the listener is secure by default through the local operating system. Therefore configuring a password is neither required nor recommended for secure local administration. However, a password can be configured for the listener to provide security for administrative operations, such as starting or stopping the listener, viewing a list of supported services, or saving changes to the Listener Control configuration. If the unencrypted password is not removed, then you are unable to set an encrypted password. To set a new encrypted password using lsnrctl, do the following: Select Listeners from the Administer list, and then select the Oracle home that contains the location of the configuration files. The Edit Listeners page appears. Click the Authentication tab. Click Require a password for listener operations.

Chapter 2 : Configuring and Administering the Listener

Be the first to ask a question about Listening to the Oracle; The Ancient Art of Finding Guidance in the Signs and Symbols All Around Us Lists with This Book This book is not yet featured on Listopia.

Trust the messages you receive from your heart. Angels and guides are communicating with you. In sweet, soft stillness, listen to their gentle whispers. If you get a nudge to speak to someone or go in a particular direction, do not hesitate. Whenever you feel challenged and you do not know where to turn, quiet your mind and listen with your heart. The correct path will appear, for Spirit wants to speak to you. There is a message for your right now. Watch the signs, and the message will unfold effortlessly. Is there an area of my life in which I need to listen to my heart rather than my mind? If I was aware of a secret message from Spirit right now, what would it be? It is your GPS, your intuition and your bridge to your dreams. So we turn away from our hearts and its beautiful messages and listen instead to our minds. The ego takes over. We protect our hearts by carefully guarding them, frightened that if we are too open we may get hurt. Where would we be now if we truly listened? What would you change right now if you were only listening to your heart? If no one could get hurt by it, no one would judge you, and you had complete self acceptance, what would you do? Would you buy a plane ticket and fly right out of here? Would you quit your job and start your own business? Become an artist or a musician? Where does your passion lie? But what I am suggesting is that you use whatever information came to you in answer to the above questions to infuse your life with more joy. Make a plan to include more of what you love into your life by steering yourself in that direction. Let your heart take the wheel.

Chapter 3 : Listen to the Oracle on Vimeo

Oracle Net Configuration Assistant enables you to configure the listening protocol address and service information for an Oracle database. During an Enterprise Edition or Standard Edition installation on the database server, Oracle Net Configuration Assistant automatically configures a listener with a name of LISTENER that has a TCP/IP listening protocol address for the Oracle database.

David Hibbs Marketing is changing. Customers are interacting with companies and brands across various channels and marketers need a better way to manage these interactions. The power of a computer is in the pocket of customers at almost every moment throughout the day. They can quickly tweet, update status, check email, look for nearby places to eat with just a couple touches. We as marketers have to change the way we approach our customers. They are in more control now than they have ever been in the past and yet we as marketers treat them all the same. We show everyone the same display ad. Display might say one thing, while our email says something completely different. Our mobile message might even be different than the previous two. You see where I am going. Those that are not jumping on the bandwagon are going to be late to the party. In any relationship, there is a give and take. Providing value and listening are key components of any relationship. In fact, if you ask my wife, listening is probably the most significant component of a successful relationship. Listening is extremely important. These needs are always changing. In digital marketing, listening to the behaviors of our customers can give us great insight to how we might want to communicate to them in the future. If we as marketers continue to focus on the merchandising and promotional calendar that we are used to, we will miss the subtleties of what the customer needs from us today. From a branding and marketing standpoint we used to approach marketing with a campaign perspective we are going to promote X, tell everyone. But this has changed. We have to treat them as if we were in a relationship listen to their needs and respond accordingly. What the customer actually wants from us takes precedence over what we might want to promote to them. We have to provide them value. We have to show them we are listening. Moving to a relationship centric approach has proven valuable at driving higher revenue per customer and most importantly higher chance of going out on that second date. Below is a few charts showing the increase in return captured from repeat customers. If we can build stronger relationships the more likely customers are to return and, in the end, the more money they are going to spend with you versus your competitor. Here is my calling to marketers. Stop trying to score on the first date. Try and show them why you are the one. Relationships never are, but lifetime commitment is waiting for you around the corner and better yet, more revenue. Why are you better than the next competitor? How are you going to solve their problems for today, tomorrow?

Chapter 4 : Listening to Straight Talk on Oracle on VMware Licensing - Database Trends and Applications

Listening to the Oracle by Skaft, Dianne The book, Listening to the Oracle [Bulk, Wholesale, Quantity] ISBN# in Paperback by Skaft, Dianne may be ordered in bulk quantities. Minimum starts at 25 copies. Availability based on publisher status and quantity being ordered.

May 06, - PMON uses the default address on the local machine, if the listener is not there, it does not register itself. If on the local machine is "wrong", you use the init. July 01, - 1: However, is it still true in 9. I find it hard to imagine how Oracle knows where to send responses. In a dedicated server environment, when Oracle wants to send data to a server process, how does Oracle know where the server process is which port it is waiting on? The dedicated server attaches the SGA, reads datafiles. That is how the pieces talk. In shared server, the client connects to a dispatcher on a port. They both "know" that port. The dispatcher and shared server use a queue in the SGA to communicate. Need to know July 01, - 3: Are you saying Oracle does not record any port specific info in the data dict? It seems like a good piece of info to have if you deploy an application that uses different SSL and non-SSL ports and needed to monitor how users are connecting. Followup July 01, - 4: If you have a real world scenario, something you are trying to accomplish, feel free to try and ask that -- seems like we are dancing around here. Why would they care what port i used last week? If you need to see how users are connecting to the database ssl, non-ssl, whatever you certainly do not need to see the port. We can tell you how they connected auditing does that Could you demonstrate how? July 01, - 8: Reader Tom, "If you need to see how users are connecting to the database ssl, non-ssl, whatever you certainly do not need to see the port. We can tell you how they connected auditing does that " Could you please let us know how the above could be accomplished? Followup July 02, - 7: July 02, - 8: MarkRem from Ashburn thanks TK, et. Any port info known to the database would be the redirect port, which is of no use in an audit of user activity. Should be very easy to do. Need to know July 03, - 9: We have to audit everything, even what ports are used for each connection. We are also using Selective Audit, which does not monitor what port is being used so that is suprising. Mark Rem - Good advice, I seemed to remember hearing that somewhere else. Follow-up on port October 06, - Havent gotten it yet coz it has not arrived the Philippines yet. How do I determine if the port for httpd which is "" is listening? I forgot the linux command that shows if that port is open. Should there be an error when starting the services if that port is down? Which port number should be opened for an Oracle Database? February 22, - 5: I have Oracle Database We will use this database for internal uses. Our security folks wants from me to tell them which ports should be open?

Chapter 5 : The Spotify versus Apple music debate – The Oracle

The best parts of this book is Skafte's imagining of what an ancient scene would look like (for example--what a petitioner to the Oracle might think or experience before, during, and after their oracular experience).

The Oracle review Away from experiments The American musicians from Godsmack have never posed themselves as the trend setters in hard rock. They realize that they are not cut out for the revolutionists in heavy music. Yet the band is really good at releasing regularly quality albums, which they have been doing for more than a decade now. And this is praiseworthy. Once having chosen song-writing and performing directions, Godsmack has been following this course all along and enhancing their skills gradually. The musical style of this ensemble is an amazing match for the format of any radio stations. On the on hand, this is rather an aggressive and heavy type of music based on dirty guitar sound originated from grunge; on the other hand, it has much space for interesting melodious solutions. This music will always have a large audience of people of different ages and tastes. Why, then, do the musicians have to change their creative views? They have no reason to do that. The Oracle, an album released by Godsmack in the spring of , presents practically the same music that we heard on their debut effort delivered more than ten years ago. The material of the former is equally good. It is difficult to draw the line between the hits and obvious fillers that only serve to drag the duration of the record. IV had gorgeous pieces here and awfully boring stuff there. A description like this can not be given to The Oracle. After that, the musicians give a break to themselves and the listeners as well as they present a half-ballad song Love-Hate-Sex-Pain, pretty thoughtful and sad piece. After all, writing voiceless material is not for Godsmack. While some performers are loved for regular modifying their sounding, Godsmack are loved for stability. In the meantime, the skills of the musicians did grow since the release of the debut effort. The Oracle demonstrates the next to perfect balance between the heaviness and melodiousness. Godsmack focused on playing not long songs that last four minutes. This time is enough for them to smash the listeners with the waves of guitar riffs, catch them with a unsophisticated melody and stun with the variegated vocals. The Oracle is just hard rock, without anything extra, unneeded philosophizing, gigantic solos and long dull intros. This simplicity is the key to success. Godsmack fans wanted to hear this very music on their new album, and The Oracle gave them exactly what they expected.
