Part of the New Perspectives series, this text offers a case-based, problem-solving approach and innovative technology for meaningful learning of Microsoft Excel This Second Edition has been updated to include basic to more advanced features of Excel.

A chart may be embedded in an existing worksheet, or can be created on a separate chart sheet, with its own tab in the workbook. The data source is organized into a collection of data series. An axis covers a range of values, called a scale. The scale is displayed by placing values alongside the axes. A chart may also contain gridlines by extending the tick marks into the plot area. Whenever there are several data series for a chart, a legend can be placed next to the plot area to uniquely identify each series with a different color or pattern. Select the embedded chart to make it active; the selection handles will appear. To resize the chart: Click and drag the embedded chart to the new location and release the mouse button Slide 11 XP New Perspectives on Microsoft Office Excel Tutorial 4 11 Moving and resizing tips When you select the chart to make it active, be sure you have clicked the entire chart, and not just one of its elements. These tips will help you select and move the entire chart, and not just one of its elements. Slide 14 XP New Perspectives on Microsoft Office Excel Tutorial 4 14 Create a pie chart Pie charts are very useful for comparing values in a data series to each other, but can only use one data series at a time. One feature of a pie chart is called exploding, in which you can slightly separate a particular pie slice from the other slices. You can explode any or all of the slices of the pie. This is referred to as an exploded pie chart. Exploding a pie chart adds emphasis to a particular area of the chart and makes it easier to notice. Slide 15 XP New Perspectives on Microsoft Office Excel Tutorial 4 15 Explode a pie chart You can explode all of the slices by selecting the entire pie itself so that all the individual pieces have selection handles. As you click and drag any portion, all the slices of the pie will explode outward from each other. When the pie is exploded out to the size you desire, release the mouse button. A fully exploded pie chart is also one of the sub- type options of the pie chart type that you will see when you use the Chart Wizard. If you wanted to remove a data series from all categories, you could delete that particular data series from the worksheet in many cases. If you want to remove a slice of a pie chart, you cannot just delete the data in the data source, but rather you must change the cell reference of the data series for the chart. Edit the series in this dialog box, or click the Collapse Dialog button to temporarily collapse the dialog box so you can drag the pointer over a new range of cells. To move an embedded chart to a new chart sheet, select the chart, click Chart on the menu bar and click Location. The same dialog box of Step 4 of the Chart Wizard will appear and you can click the option to place the chart as a new sheet and give it a name. Slide 19 XP New Perspectives on Microsoft Office Excel Tutorial 4 19 Format chart elements To format an individual chart element, select the element by clicking it and then format its appearance using the same tools on the Formatting toolbar you used to format worksheet cells. You can also double-click the chart element to open a dialog box containing formatting options, or right-click the element and then select the Format command from the shortcut menu to open the dialog box. There are three basic types of text in an Excel chart: Attached text is not linked to any cells in the worksheet; examples include the chart title and the axes titles. Unattached text is any additional text that you want to include in the chart. You can use options provided on the Patterns tab to change both the border style and the interior of a data marker. You can also edit an axis scale by double-clicking any value on an axis to open the Format Axis dialog box. In the Format Data Series dialog box, the Pattern tab includes a Fill Effects button that provides a full range of options to create sophisticated colors and patterns, such as gradient, texture or even a picture. This can be done for a data marker, but is often more appropriate for a larger portion of the chart itself, such as the plot area. You could also place graphics within the data markers, such as the columns in a Column chart. The Fill Effects dialog box options for inserting a picture are the same for data markers as they are for other areas of the chart. You can choose to stretch the graphic over the entire size of the column, or choose to stack the graphic up to the height of the column. The minimum and maximum values are the smallest and largest tick marks that will appear on the axis. The chart has a second set of tick marks, called the minor tick marks, which may or may not be

displayed; if shown, their positioning is determined by the minor unit setting. Major tick marks are displayed alongside an axis value, whereas minor tick marks, if present, are not alongside an axis value. To change a chart to a 3-D chart, select the chart, click Chart on the menu bar, and then click Chart Type. Choose the 3-D option sub-type of whichever chart type you prefer. Excel creates each 3-D chart with a default elevation, rotation and height. To change the appearance of a 3-D chart once you have created one, make sure it is an active chart then click Chart on the menu bar and then click 3-D View. Use the Drawing toolbar to add text boxes, lines, block arrows and other objects to charts and worksheets. If the Drawing toolbar is not already displayed, choose to display it by clicking View on the menu bar, pointing to Toolbars, and then clicking Drawing. Once you select a shape from the toolbar, click and drag an area on your chart or worksheet where you want to insert the object and Excel will draw it for you. Once you insert a drawing object onto a chart or worksheet, you can resize or move it just like any other object. You can also modify the fill color and border style of an AutoShape, and even insert text. Use full page, Scale to fit page, and Custom. As with worksheets, you should preview the printout before sending the chart to the printer. You can print multiple sheets at once without printing the entire workbook. Press and hold the Shift key, then click on each sheet you want to print. When finished selecting, release the Shift key and then print.
