In the waning days of the Soviet communist regime, the state-run Kuzlov Theatre in St. Petersburg is struggling. But a new production of Anton Chekhov's The Three Sisters will surely turn things around " maybe it just needs some songs even dances.

Simulations Quick Changeover SMED As lean production is dependent upon small lot sizes, small lot sizes are dependent upon quick changeovers. If set-ups or changeovers are lengthy, it is mathematically impossible to run small lots of parts with low inventory because large in-process inventories must be maintained to feed production during changeovers. For example, large stamping dies commonly took hours to change until the development of quick die change methods Single Minute Exchange of Die, or SMED. Long changeovers necessitate cycle times well below the Takt time, and hence a buildup of inventory to supply production while the die is being changed see Pull Scheduling for a discussion of Takt time. The editors are familiar with an appliance plant that is a good example of changeover problems. In order to minimize capital investment when the plant was launched, many dies were designed to make multiple parts. Not a bad idea in and of itself, but to accomplish this mission the dies had to be reconfigured in the tool room by adding or removing bolt-on modules. As a result, changeovers between parts took as long as eight hours. Massive in-process inventories were required to maintain production levels while the dies were reconfigured. The short-term decision to reduce investment through common dies was more than offset by the increase in inventory and tool-room costs! The System Dynamics were clearly not considered when the initial investment decision was made. The impetus was to reduce costly inventories and improve efficiency. An important foundation to the SMED system is the distinction between changeover work that occurs while the machine is not running, called Internal Setup, and preparatory work that occurs while the machine is running, called External Setup. At the point in time when SMED was developed, almost all changeover work was performed while the machine press was down. The SMED philosophy breaks down into four stages: In the preliminary stage, all setup work is combined. There is no distinction between internal and external work. In the second stage, external setup and internal setup are identified and separated. In the third stage, work that was previously included in the internal setup is transferred to external setup. The fourth stage requires relentless and continuous improvement of all work elements within the internal and external setup Kaizen. A useful comparison is the pit crew of a racing team changing tires. If the tools and parts are not prepared until the car enters the pit, then the pit stop will be lengthy. Changeover Time Reduction Techniques Specific techniques to reduce changeover time are: Staged Tooling and Fixtures If a part or tool must be placed into a fixture prior to an operation, such as machining, add a fixture so that while one part or tool is in the machine, the second can be set up in the fixture. Operations Conducted in Parallel Consider the pit crew example again: Standardization Tools that are the same size with the same attachment location can be changed much more quickly. Consider how long it would take a pot crew to change tires if the replacement tire had a different lug nut configuration. In the same vein, a common die height allows the shut height of the press to be set to a common dimension. Standardized attachment points and methods reduce confusion and the number of fasteners - saving time. Standardization also applies to tool storage organization so that tools can be quickly located. See the 5S tutorial of the Toolbox for additional discussion of workstation organization. Quick Attachments Clamps, cams, and u-shaped washers are used for quick attachments. If a bolt can be pre-tightened during external setup, then it only needs one final turn to provide clamping force during internal setup. Another example to consider is the quick-release hub on a bicycle tire, which facilitates rapid changeover by a lever and cam device so that a wrench and the time that goes with it is not required. No-Adjust Tooling Use locating pins, guides, and fixtures to completely eliminate adjustment. Duplicate Tooling Duplicate tooling can minimize or eliminate the need for changeovers, and the cost can quickly be offset by reduction in inventory and set-up labor costs. Simple pre-set gauges and templates can speed up changeovers without large expense. Assisted Tool Movement Large dies or other heavy tools can be moved much faster using dedicated die carts, roller tables, or small conveyors than with forklifts or cranes. Mechanized tool change equipment allows pre-staging of the replacement tool, and may

also facilitate changeovers by the base equipment operator without additional indirect labor. Benefits of reduced changeover time By incorporating the above methods, massive dies are commonly changed in less than 10 minutes - setups that used to take hours. Benefits of reduced changeover time extend beyond the direct reduction of inventory to include: Reduced lead times and improved responsiveness to customers. Flexibility to respond to changes in demand. Improved product quality from quicker information feedback. Improved visual control and plant communication. Reduction of indirect costs for material movement, counting, and transaction processing.

The back panel is the only one with three on it, so that offsets the measurements. As you can see in the pictures, it all connected correctly. You are correct, it is a bit of a challenge to get the curtains on, but that was actually intentional. Some of my events are outdoors and I was concerned about wind pulling at the curtains. In addition, I wanted the added security that the solid casing provided. Velcro or individual tabs might be easily pulled off. It really is a judgement call. A few extra minutes putting it together is well worth the added security and peace of mind to me. I used a thin denim. The denim went along with my company type, but also worked best as wind does not affect it in any way. It is heavy enough to stay in place. Francesca 2 years ago Hi, This is lovely! Thank you for posting! Also, can you clarify what you mean by smoothing the ends of the pipe when you sand it? Or is it just the back panel cause its divided by 3 and not 2? I am making it different dimensions so this is throwing me off a bit. Also, can your customers hang hangers on the back pipe-is it strong enough or will it tip? Shelly How wide was your fabric on the bolt? That includes the pvc pipe, fittings, fabric and even the glitz! That being said, I have a full 3 foot square space which fits a person, a chair AND a mirror inside the space. Many pop up tents do not have that same space. It is also a straight space, so there is no need for staying in the center of the structure. All in all it is a better value. Thanks for reading and commenting! K How much did this cost? Hopefully this will help a bit: The original cuts are the 3 foot and 1 foot pieces. Then when you trim down the pieces as described, it will give you the pieces you need to complete the frame as described. I am glad you like it! It has been a God-send for me! I apologize for the delay in responding! I was injured in an accident and have just begun to get back to normal life! They have online shopping available and I am sure they will ship! In addition, I was able to google the 3 way pieces and find them at several locations online including one on Etsy. I hope you can find them! Thanks for reading and good luck in your endeavors! Claire 5 years ago Hi, I found this a little while ago and it is a great idea and just what I need. The only problem I have is finding corner pieces for the top and bottom. What did you use? Thanks for your great idea!! S 5 years ago Hi there! Can you explain this a bit more? Also how much did everything cost? I have a friend who uses a golf club bag! Good luck and thanks for reading! Thank you for including your full design. I LOVE mine and carry the pieces in a military duffel bag. It is lightweight and easy to put together! Good luck and you are right about the curtains!! Christine Miranda 6 years ago from My office. My daughter has several recitals per year. This can easily be made into a double or triple unit for backstage. I am totally sharing this with all the other dance moms. Heavy duty curtains from a second hand store would be perfect. It is really quick to set up and take down! Send me a pic if you make one! I will add it here! I recently reunited with my previous boss, going to be her personal assistant again. She is up n coming TV personality and I can imagine there will be times we will need to change her on-set.
