We have a fix for that. Check out our list of Frequently Asked Questions or use this useful pre-sale contact form. What types of payment do you accept? Currently all our payments are processed via Credit Card and PayPal and we only accept payments online. If I upgrade from the free version to premium, how should I proceed? When upgrading to a premium version, deactivate the free version before installing the Pro or Hobbyist version. This way all your settings will be ported over. If I purchase a Hobbyist license, can I upgrade later? Sure, you just need to visit your account page and you can automatically upgrade for the price difference between licenses. This is valid for the first two months after purchase. To upgrade without losing any settings, deactivate the Hobbyist version, then install and activate the PRO one from the WP backend. After, delete the Hobbyist version. Are the licenses good for a lifetime? No, each license is valid for one calendar year from the date of your purchase. Licence keys automatically renew yearly. For unlimited updates and support you can purchase an Unlimited License. What do I get with my license? Your license grants you access to priority support, documentation resources, product downloads for one calendar year from your purchase date. What happens when my license expires? Your Licence is valid for one year from the purchase date. An active licence will grant you access to automatic updates, new features and support. Can I cancel my subscription? Yes, your subscription can be cancelled at any time from your account page. You will retain access to plugin updates and support until your licence expires, one year after the purchase date. By cancelling, your licence will not renew automatically and will expire one year after the purchase date. Once expired you will no longer receive plugin updates, new features nor have access to support. You may renew your license at any time to reactivate your subscription. The Serial Number needed for registering your version of Profile Builder is listed in Your Account page, along with some other useful information. Do you have a refund policy? Yes we do, see our terms and conditions for refund requests. Where can I find support?

You can redirect your app to use a different version of an assembly in a number of ways: This article discusses how assembly binding works in the. NET Framework and how it can be configured. Assembly unification and default binding Bindings to. NET Framework assemblies are sometimes redirected through a process called assembly unification. NET Framework consists of a version of the common language runtime and about two dozen. NET Framework assemblies that make up the type library. NET Framework assemblies are treated by the runtime as a single unit. By default, when an app is launched, all references to types in code run by the runtime are directed to. NET Framework assemblies that have the same version number as the runtime that is loaded in a process. The redirections that occur with this model are the default behavior for the runtime. For example, if your app references types in the System. XML namespace and was built by using the. XML assembly that ships with runtime version 4. If you want to redirect the binding reference to point to the System. XML assembly that ship with the. NET Framework 4, you can put redirect information in the app configuration file. A binding redirection in a configuration file for a unified. NET Framework assembly cancels the unification for that assembly. In addition, you may want to manually redirect assembly binding for third-party assemblies if there are multiple versions available. Redirecting assembly versions by using publisher policy Vendors of assemblies can direct apps to a newer version of an assembly by including a publisher policy file with the new assembly. The publisher policy file, which is located in the global assembly cache, contains assembly redirection settings. For example, redirections from version 2. However, a redirection from version 3. Each major version of the. NET Framework has its own publisher policy file. Vendors should use publisher policy files only when the new assembly is backward compatible with the assembly being redirected. You can bypass publisher policy for your app by specifying settings in the app configuration file, as discussed in the Bypassing publisher policy section. Redirecting assembly versions at the app level There are a few different techniques for changing the binding behavior for your app through the app configuration file: Manually editing the app config file You can manually edit the app configuration file to resolve assembly issues. This means that if two components reference different versions of the same strong-named assembly, the runtime automatically adds a binding redirection to the newer version of the assembly in the output app configuration app. This redirection overrides the assembly unification that might otherwise take place. NET Framework component but uses a third-party library that targets an older version of the same component. When you compile the app, the output app configuration file is modified to contain a binding redirection to the newer version of the component. If you create a web app, you receive a build warning regarding the binding conflict, which in turn, gives you the option to add the necessary binding redirect to the source web configuration file. If you manually add binding redirects to the source app. You can override this default behavior by providing binding redirection information in the app. For information about how to turn this feature on or off, see How to: Enable and Disable Automatic Binding Redirection. Bypassing publisher policy You can override publisher policy in the app configuration file if necessary. For example, new versions of assemblies that claim to be backward compatible can still break an app. If an assembly has a publisher policy file, the vendor should make sure that the assembly is backward compatible and that clients can use the new version as much as possible. Redirecting assembly versions at the machine level There might be rare cases when a machine administrator wants all apps on a computer to use a specific version of an assembly. For example, the administrator might want every app to use a particular assembly version, because that version fixes a security hole. The machine configuration file overrides the app configuration file and the publisher policy file. The oldVersion attribute can specify a single assembly version or a range of versions. The newVersion attribute should specify a single version. The following code example demonstrates a variety of binding redirect scenarios. The example specifies a redirect for a range of versions for myAssembly, and a single binding redirect for mySecondAssembly. The example also specifies that publisher policy file will not

override the binding redirects for myThirdAssembly. To bind an assembly, you must specify the string "urn: This optional attribute uses a. NET Framework version number to indicate what version it applies to. For example, to redirect assembly binding for a. For example, enter assembly binding redirection information for. Finally, enter assembly binding redirection information for any. NET Framework assembly redirection that does not use the appliesTo attribute and therefore applies to all versions of the. If there is a conflict in redirection, the first matching redirection statement in the configuration file is used. For example, to redirect one reference to a. NET Framework 4 assembly, use the pattern shown in the following pseudocode. NET Framework version 3. NET Framework version 4.
