Office of the VP for Communications “ Keeping alumni and friends connected to U-M Starry, starry nights In Victorian steam-era Ann Arbor of the mid-to-late 19th century, the most extraordinary stargazing took some work. To see stunning detail of the moon, Jupiter, Saturn, and other celestial bodies, one had to reach up, grab thick ropes, and pull. Detroit Observatory volunteer Marina Kounkel, is a graduate research assistant studying star formation. Here, she helps pull the rope to engage gears that turn the dome, to position the shutter opening over the telescope. Eric Bronson, Michigan Photography. The ropes engaged wall-mounted gears. Once engaged, they rotated and positioned the track-mounted dome of the new Detroit Observatory. It was an awe-inspiring adventure then, and today as well. She is a graduate research assistant studying star formation, and a regular volunteer who shows up for viewing nights in near period dress. Shannon Murphy, a Department of Astronomy staff member who helps oversee viewing nights, says volunteers are essential. It now overlooks the sprawling steel-and-glass facade of the Comprehensive Cancer Center. To enter from Ann Street, one must climb steep stone steps to the front porch of the Italianate-style observatory. There are no steps to climb from Observatory Street, leading to the rear of the building. Inside, voices nearly echo off the hardwood floor and plaster walls. The room holds only the telescope, mounted on a limestone pier atop a concrete pillar and aimed to the sky. Besides manipulating the dome, volunteers also help with tasks that include winding the spinning brass clock drive. Soon, failing light turns the room to dark shades of gray. Close to two dozen people fascinated with history, adventure, and the cosmos have mounted the stairs to enter the dome room. Several chat as a line forms to look through the Fitz refractor. Did you ever see anything as defined as that? Both are attending for their astronomy class. The room is nearly dark now. He also speaks to the group. It was named the Detroit Observatory as a nod to Detroit businessmen who contributed to its construction. I can see clearly now Significant astronomical research was conducted at the observatory. Between , James Craig Watson, a former student of Brunnow and second observatory director, discovered 21 asteroids using its telescope. Two comets also were discovered, and significant research was conducted. On viewing nights, people line up in the dusk to take turns looking through the Fitz refractor. This is his first viewing. This summer, viewing nights will also feature Saturn and Mars and the maize-and-blue double star Albireo. Time travel On this recent evening, the group shares a 19th-century moment not available to modern, computer-linked telescope viewers. Next, the telescope is repositioned to view Mars. On this night, the red planet appears as a dull white grape. The fact that they got the observatory operating after all these years is incredible. Growing light pollution from burgeoning adjacent development affected the telescope, and the facility was used less and less. Some suggested closing the building, which fell into near disuse, or tearing it down. The observatory building and instruments were restored in During the International Year of Astronomy in , the first public viewings were scheduled, and they became a regular feature the following year. You can see this tremendous gathering of stars all clustered together, and shifting veils. A favorite was April 30, A view from the dome room at the Detroit Observatory.

Vision Board Workshops Take charge of your future! Vision Boards have helped numerous people gain clarity, focus on goals, and achieve them! Join us for a full day mini-retreat, with activities, guidance, and supplies to create your vision board! We may do some drawings or paintings to add to our board, so it will definitely be a multi-media kind of day! Take some time for YOU and enjoy the day! Screen Printing workshops Print your own T-shirts, bags, etc! This workshop is time consuming, but worth it! Create your own design or saying, and prepare a screen for printing it on shirts, bags, and more! Print your image on up to 3 items that you provide - there is a small fee for printing more than 3 items; ask for details. Acrylic Painting classes Bring out your inner Van Gogh! Acrylic paint is a very easy to use medium. We paint on canvases or canvas panels. Come and enjoy the evening painting with some friends! Alcohol Ink A fun, vibrant medium! Come and try your hand at an alcohol ink painting! This medium is known for vivid colors and fun application! Everything you need to complete a painting is included! Drawing Classes Sketching, 3D drawing, zentangles and more! Classes are changing and being added all the time! Classes may include 3D sketching with emphasis on shading and perspective, anime figures and faces, or zentangles - a meditative doodling art form that is fun and relaxing! This medium was very popular for centuries, learned by many, but now many people have never used watercolors. Come and rekindle your love of art with this soft, beautiful medium using high quality watercolor paper. What a better way to celebrate with an art lover than to have an art birthday party! These are tailored to your preferences, so prices vary. Any of our classes can be offered as a party, but we are open to your ideas as well! Bring your cake and snacks - small kitchen is available for the day of the party. Kids Arts and Crafts Fun for the little ones! Check the calendar for Kids Arts and Crafts! We are always adding new things! Not all will be listed here, but clicking the "Calendar" button below, or following us on Facebook [starrynightalaska](https://www.facebook.com/starrynightalaska) will give you the latest news!

Chapter 3 : Montalvo Arts Center | Starry, Starry Night

starry nights night glow board books Thu, 18 Oct GMT starry nights night glow board pdf - If you are looking for the book by Judith Moffatt Starry.

Perfect cheesy romance novel to keep you warm and cozy through the long winter. Not too Christmasy, just enough to make me feel some love and holiday cheer. Finn and Carrie are both well developed characters, and you cheer for the their relationship. Starry Night is a fun light book for the holidays and fans of Hallmark Christmas movies. Like LibrarySquare Feb 04, When Carrie threatens to resign her job at the newspaper, her boss makes a deal with her. If Carrie can find Finn, the popular but elusive writer of outdoor adventure books, her boss will allow her to move from society page editor to become a serious reporter. And Finn never dreamed his first novel would captivate readers. He wants to remain secluded in the wild, away from reporters looking for an interview. Highly motivated, Carrie heads to the back country of Alaska in search of Finn. I especially liked the descriptions of the Alaskan wild, the vast endless snow, and the starry, midnight blue sky. Like v VV17 Oct 21, Debbie did a great job in her character and plot development. The Alaskan, Chicago, and Washington St. There was one scene that contained two words I thought could have been avoided and replaced with more comical substitutions. However, like her other stories, Debbie does a great job in encouraging and uplifting her audience. Personally, I would rate her angelic intervention stories a little higher because of the comical twists and the more inspirational tone involved in those particular books. Overall, this is a great Christmas read! Like kimrae Dec 18, A good, heart warming story that I found myself smiling while I read. Like f foxy lady31 Apr 02, Wonderful romantic story. Love stories make me cry so dont read them a lot but glad I picked this one up. Like Unable to cancel hold. I wanted ebook not regular book. When she has the opportunity to look for and interview a reclusive author, Finn, who wrote a very popular book - "Alone" - about surviving and thriving in the Alaska bush, Carrie decides to go for it. The bulk of this story is about her search for Finn, and what happens when she finds him. Reading about life in Alaska and the starry starry nights and aurora borealis reminded me about my time living in Alaska. That made this story extra special for me.

The Board Book of the Starry Nights by Judith Moffatt at Barnes & Noble. FREE Shipping on \$ or more!

We spend the majority of our time in buildings and vehicles. Thus, pictures of starry nights and brilliant lighthouses make us gasp because we are unaccustomed to communing with the night. The images in this blog contain much more information than you might think. Stars, in my opinion, are little lighthouses nature put in the sky to guide and delight us. This is how the beams of a Fresnel lens appear from underneath the lantern, each one cast through its bulls-eye and fanned out as the light encounters moisture and dust in the air. Some of us are more photosensitive than others; we can see more in the darkness. But none of us can see as well as a camera lens. Cameras can pick up much more faint light. Thus, a camera goes deeper into the night and sees more stars, more nebulous stardust, and it sharply defines the beams of light coming from a lighthouse lantern. At the equator, it turns about 1,000 mph, though we cannot sense the motion. In the time Coffman left the shutter open on his camera to capture this image--maybe twenty seconds or so--the Earth moved a little under the stars. Movement, as we know, makes photos blur. I do miss that! This is the southern hemisphere sky, which for some peculiar quirk of nature has fewer visible stars than the northern hemisphere. It has something to do with the direction of the Milky Way, which has many more stars than other places in the sky. Notice how the stars seem like little dashes. The effect is that the stars began to make little trails, small lines that showed the Earth movement under the stars while the camera shutter was open. The longer a camera shutter stays open on the night sky, the longer the little star trails will be! These have awesome star trails! But to our eyes, and for mariners, it works as a guide star to locate the Celestial North Pole. Why is that important? This is why Polaris, or the North Star, is so famous. I could go on and on! Instead, let's look at more images. Here are more shots of beautiful lighthouses and the Celestial North Pole-- East Point Lighthouse in New Jersey, photographed by Jack Fusco, looks incredible under its canopy of star trails. Fusco undoubtedly took this image on a windless night and left the shutter on his camera open for maybe an hour. Look how long the arcs of the star trails are! It makes a complete circle in 24 hours, as do all the other star trails. On most nights, three or four of them streak overhead every hour. They are sometimes called Falling Stars, but they have nothing to do with the stars. They only last a few seconds, and very few of them reach the ground. During meteor showers, there are lots more of these extraterrestrial interlopers! Check out the image below of the Geminid Meteor Shower over St. Geoff Robinson took this terrific image. Exposure time was short for his camera, just a few seconds I think. You can see some stars in the background, but not nearly so many as would be seen in a long exposure image. Robinson definitely took the advice of poet John Donne: They occur when Earth passes through debris areas left behind by comets that have swung through our solar system. The Perseids and Leonids are usually the best showers for sheer numbers of meteors. The Leonids are coming up in a couple of weeks. Go out and look for them, camera or not. If the sky is clear, after midnight you might see thirty or more meteors per hour. Seem is the operative word: The stars of Leo are actually at different distances from us--very great distances indeed! The Leonid meteors are close, maybe a few hundred miles up, shooting down to Earth against the backdrop of the constellation Leo. Some photographers delight in lining up a lighthouse beacon with the North Star. Marks Lighthouse, Florida by Mark Wallheiser. Compare the two images of Bodie Island Lighthouse and St. Can you see that Polaris is higher in the sky in North Carolina than in Florida? I love the pink glow on the northern horizon of both of these images. Have a look at this next image. Image by Random Lights Photography. The Southern Celestial Hemisphere shines over it. Navigators and stargazers look, instead, for the Southern Cross, a crucifix-shape of stars near the Celestial South Pole. The hub is relatively empty--no bright star there to steer by. No Polaris of the South, no South Star. Notice how many more stars trails Mophett captured than Prokopenko. Prokopenko, however, caught a nice meteor streaking behind the lighthouse. There are many, many stars in the sky, from wherever you look upward--"billions and billions" as Carl Sagan liked to remind us in his authoritative but mellifluous voice. There are, indeed, more stars than the eye can discern, or even a good camera for that matter. And there are billions of galaxies in the universe, each with billions of stars. That Sagan word, "billions," does get a workout

when talking about the cosmos! If it makes you feel small and inconsequential, well But you have company, I think, here and elsewhere. Nature programmed us to love a starry night, a light in the darkness. Possibly, in some other galaxy, far far away, on some planet like ours, other beings have built lighthouses and invented cameras All this discussion of lighthouses and stars--pharology and astronomy--urges me to head out to a lighthouse the next clear night and have a look for myself. No tickets are needed, no admission fee. Coast Guard, which keeps our lighthouses shining. If you live in Florida, you might enjoy my book *The Florida Night*, a guide to amateur astronomy and stargazing in Florida.

Chapter 5 : Starry, starry nights | Michigan Today

Shows various creatures enjoying a summer evening under the light of the moon and stars, with glow-in-the-dark pages that can be "charged" under a light.
